# COMPARATIVE STUDY OF SIMULATION TOOLS STAAD.PRO AND ETABS SOFTWARE FOR MULTI-STOREY BUILDINGS

Himanshu Yadav<sup>1</sup>, Ramanuj Jaldhari<sup>2</sup>,

<sup>1</sup>*M.* Tech Scholar, Department of Structural Engineering, Kautilya Institute of Technology & Engineering, Jaipur, <sup>2</sup>Assistant Professor, Department of Civil Engineering, Kautilya Institute of Technology & Engineering, Jaipur,

Abstract— The principle objective of this thesis work is to detailed study the simulation tools (ETABS 2016 and STAAD.ProV8i) for analysis and design of a multi-storied building. The design methods used in STAAD.Pro and ETABS are limit state design method as per Indian standard code. ETABS and STAAD.pro features a state-of-the-art user interface, visualization tools, influential analysis and design engines with progressive finite element and dynamic analysis abilities. From model generation, analysis and design to visualization and outcome verification, STAAD.Pro and ETABS software are the expert's choice. First, this thesis work considered a reinforced cement concrete frame in STAAD.Pro and ETABS software with the dimension of 4 bays @4.0m in x – axis and 6 bays @ 4.0m in z- axis. Where bay stands of the distance between two columns or member. The y-axis of structure consisted of height of building (G+4, G+30 floors). Each Floor has specific height as per structure criteria. In this structure all floor had 3 m height each. Design of respective structure for Wind Load, Dead Load, Live Load and seismic load for calculation of all loads prefer IS 875(part-1), IS 875(part-2), IS875(part-3), IS1893-2002 Code. Indian Standard code 875(part-3)-1987gives complete information about design of Wind load effect on building. Wind load calculation for G+4 and G+30 floors structure by STAAD.Pro and ETABS software with consideration of given wind intensities at different level of structure and design structure for wind load as per IS 875(part-3) code.

# Keywords— Analysis, Design, STAAD PRO, ETABS, Residential building, gravity load, shear force, bending moment and axial force

# I. INTRODUCTION

STAAD.Pro and ETABS software are user approachable software which areused in design and analysis of any structure with precise result and minimum time consumption. Generally, we design a multi-storeyed structure by manual method but time consumption in manual method is more as compare to software method. Generally, we observe that design and analysis of multi-storeyed building using STAAD.Pro and ETABS have more accurate result and less time as compare to manual method. So, in new era we use software for design and analysis of structure and software design and analysis is economic as compare to manual method. STAAD.Pro and ETABS are not two software for design and analyses of structure instead of much software are used in market as per their specification. Our thesis involves comparative analysis and design of G+4, G+30 multi-storeyed building by using trending software STAAD.Pro and ETABS.The Reason behind use of these software in our project Given below: -

- 1. STAAD.Pro and ETABS provide easy interface for design and analysis of multi-storeyed building
- 2. Accuracy of STAAD.Pro and ETABS result are more accurate as compare to manual method of Reinforced cement concrete Structure design result.
- 3. STAAD.Pro and ETABS have multilateral software for solving any type of design and analysis problem.
- 4. One of the most advantage is that STAAD.Pro and ETABS software works with Indian standard codes.
- 5. STAAD.Pro and ETABS software works faster than other software so these software's are more popular than other.

#### II. OBJECTIVE OF THE STUDY

To carry out the modelling and analysis of Reinforced cement concrete framed structure using STAAD.Pro and ETABS.

- The main objective of this study-oriented work is to comprehensive study the simulation tools for analysis and design of structure.
- > Comparison of simulation tools STAAD.Pro and ETABS for vertical geometrical multi-storey building.
- > To design a difficult plan of multi storey building structure as per IS code.
- > To find out shear force, bending moments and deflection of multi-storey structure.
- > To compare the results obtained from STAAD.Pro and ETABS for deep understanding of software.
- > To observe the software gives more accurate and economical result.

#### **III. LOAD CONSIDERATION**

As per Indian standard code 875 (part-2)-1987Live load is a load which acts on a structure for fix time period. Live loads for buildings and structures are different for different condition. Live load keeps change time to time for same structure. Different type of live loads act on a building structure, some of them are given below:

- Weight of human body
- Weight of movable furniture
- Dust weight
- Vehicle load
- Movable object

#### IV. WIND LOAD:-

As per Indian standard code875 (part - 3) 2015 Wind load on a building structure works as a randomly applied dynamic load. Effect of wind load on structure depends on velocity of wind, air density, orientation of the structure, area of contact and shape of structure.

According to Indian standard code wind load calculations are given below: -

Where

 $V_Z$  = design wind speed at any height z in m/s;

 $k_1$  = probability factor (risk coefficient) (see 5.3.1 IS 875 PART -3 2015);

 $k_2$  = terrain, height and structure size factor (see 5.3.2 IS 875 PART -3 2015);

 $k_3$  = topography factor (see 5.3.3 IS 875 PART -3 2015).

#### V. SEISMIC LOAD

As per Indian standard code1893 (part-1):2002Seismic load is defined as the produced dew to action of earthquake. The total design lateral force or design seismic base shear ( $V_B$ ) along any principal direction shall be determined by the following expression:

Where

Ah = Design horizontal acceleration spectrum value as per clause 6.4.2 (IS 1893 (Part -1): 2002), using the fundamental natural period Ta as per IS 1893 (Part -1): 2002 in the considered direction of vibration,

W =Seismic weight of the building as per IS 1893 (Part -1): 2002.

#### VI. DESIGN AND ANALYSIS WITH STAAD.PRO V81 & ETABS

STAAD.Pro and ETABS have two methods for creating the structure. These methods of creating the model are given below: -

- Using the command file
- Using the graphical model generation mode, or graphical user interface (GUI).

The command file is text file which covers the data for the structure being modelled. This file contains of simple English language like commands. This command file is automatically created behind the scenes when the structure is generated using the graphical user interface.

Figure 1. Graphic User Interface Screen of ETABS & STAAD. Pro

#### A. DESIGN PARAMETER: -

STAAD.Pro& ETABS software Contains many numbers of parameters which are needed to perform design as per is 13920(Ductile detailing of reinforced concrete structures subjected to seismic forces). It accepts all parameters that are needed to perform design as per Indian standard code 456-2000.

## VII. ANALYSIS AND DESIGN RESULT OF G+4 RCC FRAMED BUILDING USING STAAD.PRO & ETABS

Figure 2. Isometric view of G+4 Storey Building in ETABS

All columns = 0.30 \* 0.40 m All beams = 0.30 \* 0.23 m All slabs = 0.2 m thick Parapet = .10 m thick RCC

A. PHYSICAL PARAMETERS OF BUILDING:

Height = 3m + 4 storeys @ 3m = 15m

Note: 1.0m parapet being non- structural element for seismic purposes, is not considered of building frame height

Length = 6 bays @ 4.0m = 24.0m

Width = 4 bays @ 4.0 m = 16.0 mLive load on the floors is 4 kN/m2Grade of concrete and steel used:

Concrete – M 25 Steel – Fe 415

#### B. LOADING ON STRUCTURE: -

In this multi-storey building structure, we use different load case and these loads are categorizes as:

- Self -Weight of structure
- Dead load of structure
- ➤ Live load
- ➢ Wind load
- Load combinations

#### VIII. ANALYSIS AND DESIGN RESULTS OF G+30 MULTI-STOREY BUILDING USING ETABS

# A. PHYSICAL PARAMETERS OF BUILDING:

Height = 3m + 30 storeys @ 3m = 93m

Note: 1.0m parapet being non- structural element for seismic purposes, is not considered of building frame height

Length = 6 bays @ 4.0m = 24.0m

Width = 4 bays @ 4.0 m = 16.0m

Live load on the floors is 4 kN/m2

All columns = 0.60 \* 0.60 m

All beams = 0.30 \* 0.40 m

All slabs = 0.2 m thick

Grade of concrete and steel used:

Concrete - M 25

Steel - Fe 415

B. LOADING ON STRUCTURE: -

In this multi-storey building structure, we use different load case and these loads are categorizes as:

- Self -Weight of structure
- Dead load of structure
- Live load
- Seismic Load
- Load combinations

#### IX. POST PROCESSING MODE

Figure 8.Post Processing Mode In ETABS

#### X. CONCLUSION

- ➢ For multi-storey building (more than G+25 floor) STAAD.Pro software not work properly (Hanging problem) and for same case ETABS works smoothly.
- > ETABS offered smaller area of mandatory steel as compared to STAAD. PRO.
- > STAAD.Pro software is more flexible to work for new users compared to the ETABS software.
- Axial forces calculated by STAAD.Pro are nearly similar to the axial forces calculated by ETABS, so may adopt the analysis values for the design purposes.
- The analysis values in both software's STAAD.Pro and ETABS are almost similar but design values are slightly different.
- Analysis and Design was completed by using ETABS and STAAD.Pro software successfully verified as per IS456:2000.
- The quantity of concrete requirement is same for the design of the multi-storied building using both STAAD and ETABS analysis.
- Units of building data can be changed any time in ETABS software and in STAAD.Pro units can be changed anytime but, some results show by its selected default unit, dimension marking value remains same in previous unit even after changing unit.
- Command or design parameters are assigned by user in STAAD.Pro and in ETABS software no need to assign, just run analysis and design by code selection.
- ETABS software provide special feature of checking all design data as per code and STAAD.Pro not provide this feature.
- Column Shape and orientation clearly mention in ETABS software and in STAAD.Pro Column assign by a point only and size and orientation not mention.
- Shear wall can be designed easily in ETABS as compare to STAAD.Pro.
- > Pick up Column can be designed by ETABS software and STAAD.Pro software not design pick up column.
- Diaphragm concept can be applying for slab (for Earthquake) in ETABS Software and in STAAD.Pro we can't be apply Diaphragm concept.
- Building view limit function available in ETABS software and in STAAD.Pro software we can't view particular floor of building.
- > Each element can be on or off according to requirement in ETABS.
- Main beam is not splited into two parts when secondary beam is resting on main beam and in STAAD.Pro main beam splited into parts.
